AI/ML Tools for Research KICC Workshop

Will Handley, Miles Cranmer, Boris Bolliet, Vasily Belokurov

Kavli Institute for Cosmology, Cambridge
Institute of Astronomy, University of Cambridge
DAMTP, University of Cambridge
Cavendish Laboratory, University of Cambridge
willhandley.co.uk/talks

23rd July 2025

Overview

- ► Follow-up to successful Part II/III training.
- ▶ Focus on "doing" not "explaining".
- Three layers of AI tools framework.
- Interactive demonstrations.
- 90 minutes then tea.

Common questions:

- "Which model should I use?"
- "Don't these things hallucinate?"
- "How do I get started?"
- "Is this worth the investment?"

now do i get started?

Previous session covered:

- Academic practice and Cambridge policies.
- How LLMs work and their limitations.
- Bias, hallucinations, and mitigation.
- Privacy and intellectual property.
- Model landscape and responsible usage.

 $\label{lem:previous slides: docs.google.com/presentation/d/1rnbk7WZUjMIAGBzkN6i8v0tEe1imiHprvL1Z0js2B20 \\$

First things first

If you've been busy, the past six months have seen a couple of inflection points

- February 2025: Models acquired many of the capabilities we prize in our PhD students
 - ▶ Models: o3 series, Gemini 2.5, Claude 3.5 Sonnet.
 - ▶ Capabilities: Code development, mathematical reasoning, literature review, paper & grant drafting.
- ▶ May 2025: Agentic systems launched commercially
 - ► Tools: Claude Code, Cursor agent mode, Deep Research.
 - ► Capabilities: Writing test suites, assembling pip-installable codes, synthesising handwritten notes and TeX files, write/run/debug code in languages you don't know.
- ▶ The performance gap: Free models lag significantly behind paid versions

If your lived experience is typing a research question into free ChatGPT at the start of the year and finding it was rubbish, things have moved on

On Al Hype

- These things are not "intelligent" in the way Silicon Valley wants you to believe (AGI is not just around the corner).
- Caveat emptor: It is very hard for a human to read language, and not reflexively construct a mind behind it.
- You should not however think of them as mere "next token predictors":
 - The modern reinforcement learnt reasoning systems are significantly more than that.
 - Agentic tools ground these in reality.

A senior examiner's experiment

- ▶ I got o3 to take the Part II exams.
- Prompt on exam day: "You are a first class Part II Cambridge astronomy student... here is the syllabus... here is the question, answer it".
- Toby Lovick transcribed answers onto written exam scripts.
- Slipped them amongst real scripts and marked blind.
- Result: Best student we've had across IoA history, even without coursework.

Models

Companies

Models

Under the hood

Companies

Models

Under the hood

Companies

Models

Others exist: Perplexity. Poe. Character.ai, You.com, Cohere, xAl, Llama...

Under the hood

Companies

Models

Others exist: Perplexity. Poe. Character.ai, You.com, Cohere, xAl, Llama...

But these are the three main pillars (July 2025).

Three layers of AI tools

A framework for understanding the landscape

Layer 3: Agentic Systems

- Claude Code, cursor agent mode.
- Custom workflows.

Autonomous task completion.

Interactive problem solving.

Completes code as you type.

Good for exploration and learning.

▶ Steeper learning curve but transformative.

Layer 2: Chat-based Al

- ChatGPT, Claude, Gemini.
- Web interfaces.

Layer 1: Autocomplete

- ► GitHub Copilot.
 - VS Code extensions.

Minimal learning curve.

willhandley.co.uk/talks

<wh260@cam.ac.uk>

Layer 1: Autocomplete

Standard code-completion, but powered by AI

Core idea

- Al-powered code-completion.
- Trained on all of GitHub.
- Context-aware suggestions.

Recommendation

- GitHub Copilot (Pro subscription).
- Free for university email holders.
- github.com/settings/education/benefits.
- ▶ Worth \$10/month.
- Also available in Cursor.

```
latexwill handley<texmk 1:vim 2:zsh 3:vim 4:zsh 5:claude- 6:vim*will@maxwell 22 Jul 89:29
       Aframetitle(Laver 1: Autocomplete)
       \framesubtitle/Standard code-completion, but nowered by AT)
           \column(0.48\textwidth)
           Aberin(block)(Core idea)
               Abegin(itemize)
                   Aitem AT-nowered code-completion.
                   Vites Trained on all of GitHub.
                   Aitem Context-aware suggestions
           \end(block)
           \begin(block){Recommendation}
               Abegin(itemize)
                   \item GitHub Copilot (Pro subscription).
                   Vitem Free for university email holders.
                   \item \url(github.com/settings/education/benefits).
                   Vitem Worth \$10/month.
                   litem Also available in Cursor.
               \end(itemize)
           Vend/block1
           \column(8.48\textwidth)
               includegraphics[width=\textwidth]{figures/copilot_screenshot.png}
 2 \end{frame}
-- INSERT --
                                                                             227.13
```

Layer 2: Chat-based Al

The usual chat versions

ChatGPT chat.openai.com

Claude

Gemini gemini.google.com

Layer 2: Developer versions

Use their developer level tools

OpenAl Playground platform.openai.com/playground

Claude Workbench console.anthropic.com/workbench

Google AI Studio aistudio.google.com

These should be your default as a scientist – if you're happy using a command line, you shouldn't be satisfied by an interface that looks like a child's toy.

Layer 2: Chat-based Al

Use AI to improve AI

- Likely the layer of Al most familiar to you.
- "chatting" /conversation can be very powerful for naturally tuning the attention/context of the model.
- For one shot work, a little prompt engineering goes a long way:
 - You can use these tools to improve prompts.

```
21 How could I improve this prompt?:
18 You are a first-class Part II Astronomy student at the University of Cambridge
17 You are taking your evams.
15 Here is the syllabus for the course:
13 [INSERT SYLLABUS HERE]
 9 Here is the question in LaTeX format:
 7 [INSERT QUESTION HERE]
  5 The question has marks allocate to each part, which indicate the expected length of the answer.
  3 Please provide an answer appropriate to the amount of material a student could provide in half an hour (which
   s on average how long students have to answer each question in the exam).
   Your answer should be in latey.
```

Layer 2: Chat-based Al

Use AI to improve AI

- Likely the layer of Al most familiar to you.
- "chatting" /conversation can be very powerful for naturally tuning the attention/context of the model.
- For one shot work, a little prompt engineering goes a long way:
 - You can use these tools to improve prompts.

```
35 You are a first-class Part II Astronomy student at the University of Cambridge, aiming for a distinction, Y
   ou are currently sitting an examination. Your answers should reflect the depth of understanding, precision, cla
   rity, and analytical skill expected of such a student.
33 Context:
 32 * You have, on average, 30 minutes to formulate and write down your answer for this question. The length
   and detail of your response should be appropriate for this time constraint.
 31 * You must only draw upon material typically covered within the provided syllabus. Do not introduce exter
   nal knowledge unless it's a foundational concept implicitly assumed by the syllabus.
29 Inputs:
 27 1. Syllabus for the Course:
       FINSERT SYLLABUS HERE?
       * Your answer must be demonstrably rooted in the topics and concepts outlined in this syllabus.
       Examination Question (LaTeX format):
       ETNSERT QUESTION HERE!
       * Pay close attention to the mark allocation for each sub-part of the question. This indicates the expec
   ted death and breadth of your response for that part. Allocate your effort and answer length proportionally
 15 Output Requirements:
       Format: Your entire answer must be in valid LaTeX format.
       * Use standard LaTeX mathematical environments (e.g., equation, align, gather) for any equations
       * Clearly structure your answer, perhaps using \section* or \subsection* for distinct parts of the qu
   estion if appropriate, mirroring how a student might structure their handwritten response,
       Style and Content:
           Academic Rigour: Provide precise definitions, clear derivations where necessary, and logical argume
           Conciseness: Re thorough but avoid unnecessary verbosity. Exam answers need to be to the point.
           Clarity: Explain concepts clearly, as if to an examiner who is an expert but needs to see your up
   derstanding.
           Assumptions: State any assumptions you make clearly.
           Diagrams/Figures: If a diagram would significantly aid an explanation (and could plausibly be sketc
   hed in an exam), you can describe what it would show, e.g., "(A sketch here would show... with axes labelled.
    and key features highlighted.... 1". You don't need to generate the LaTeX for the diagram itself unless specific
   ally asked or trivial (like a simple \rightarrow).
           Units: Ensure all physical quantities are accompanied by appropriate units.
           Problem-Solving: If the question involves calculations, show your working systematically.
   Please provide a comprehensive yet time-appropriate answer to the examination question, adhering to all the ins
   tructions above.
-- INSERT --
                                                                                                36.128
```

Layer 2: Cost

Pay as you use vs subscription models

- ▶ Gemini is free to use (but you sign away your data).
- ► ChatGPT and Claude offer \$20/month subscriptions.
- ► API access available: pay per token consumed:
 - ▶ \$0.0002-0.015 per 1000 tokens (roughly 750 words).
 - Orders of magnitude cheaper for research use.
 - Only pay for what you actually use.
- Never buy yearly subscriptions AI evolves too rapidly.
- My group's preference: pay for API access via tokens.
 - Pay for what you use.
 - Allows you to try out the latest models.
 - API keys allow you to do all kinds of tricks at the command line.

Layer 3: Agentic Systems

Autonomous task completion - transformative but complex

- Emerged commercially in April 2025.
- If you get too skilled at chat-based AI, your job ends up being a copy-paste-run-debug monkey.
- Agentic systems are what happens if you let ChatGPT edit files, run commands, and inspect the behaviour.
- This closes the scientific loop.
- Agentic systems are (partially) grounded in reality. Correctly guided, they can reduce hallucinations by testing their hypotheses.
- ▶ Claude Code (CLI), Cursor Agent mode, Gemini CLI.
- Deep research also falls into this category.
- Goal-based vs task-based.

```
undley 0:latexmk 1:vim 2:zsh-3:vim 4:zsh 5:claude* will@maxwell 22 Jul 89:
                             \hesin(itemize)
      330
                                 \item \$0.01-0.10 per 1000 tokens (roughly 750 words).
                                 Vitem Orders of magnitude cheaner for research use.
                                 litem Only pay for what you actually use.
• Updated the pricing to the accurate range: $0.0002-0.015 per 1000 tokens, reflecting
 current API costs that are significantly lower than the outdated figures.
Another update to that problem figure in the latest screenshot

    Bash(ls -la /home/will/screenshots/ | tail -1)

 -rw-r--r- 1 will will 60199 Jul 22 08:59 2025-07-22 08-59-29.png

          \end(frame)
Do you want to make this edit to will_handley.tex?
 2. Yes, and don't ask again this session (shift+tab)
  3. No. and tell Claude what to do differently (esc)
```

Layer 3: Agentic Systems Cost

More expensive but potentially more valuable

- Significantly more expensive than chat-based AI.
- Can consume hundreds of API calls per task.
- For agentic systems, subscriptions *are* cheaper than pay-per-token.
- ▶ I was spending \$40/day on Claude Code with API tokens.
- ► Subscription gives you about 2hr coding session per day for \$20/month/user.
- Gemini CLI is "free" but risks going over free tier limit, and is less stable.
- ▶ In July 2025, Claude Code best in class.
- ▶ There are many further unknown costs of shifting your research toward "hands-free coding".

Conclusions and Getting Started

- Use developer-level tools, not consumer interfaces.
- ▶ API access typically cheaper for research use.
- Capturing and owning content is critical use Otter for transcription.
- Export conversations and notes in formats that can be fed to LLMs.
- Get into the habit of recording information in exportable forms.
- Agentic systems are transformative but carry additional risks requiring careful consideration.

To-do

- Set up GitHub Copilot Pro (takes a couple of days to approve).
- Try Al Studio rather than ChatGPT.
- Get your PI to set up some tokens for your group to use (you only need O(\$10) to try it out).
- ► Try Google Gemini's Deep Research **button**.
- ► Test Claude Code/Gemini CLI for a month.
